

RUBRIC FOR MIDTERM MCO

CRITERIA	EXCELLENT (4)	GOOD (3)	FAIR (2)	POOR (1)
Understanding of human factors and HCI concept– 23%	Shows clear and accurate understanding of relevant human perceptual, motor, cognitive, and motivational concepts; uses correct HCI terms and explains them in context of the chosen interface.	Shows generally accurate understanding of key HCI concepts with minor gaps or small inaccuracies; terms are mostly used correctly and connected to the interface.	Shows partial or shallow understanding; some important concepts are missing, misused, or only mentioned without explanation or clear link to the interface.	Little or no evidence of understanding; concepts are incorrect, very vague, or not connected to the analysis.
Depth and accuracy of analysis– 27%	Analyzes multiple aspects of the interface (perceptual, motor, cognitive, motivational) in depth; clearly identifies both strengths and problems and explains why they matter for users.	Provides a solid analysis of the main aspects with some depth; may miss a few subtler issues, but overall explanation of strengths and problems is clear and mostly accurate.	Analysis is surface-level; focuses on obvious or purely aesthetic comments; important usability or human-factor issues are missed or misinterpreted.	Very minimal analysis; mostly description of what the interface looks like or does, with almost no evaluation or incorrect conclusions.
Use of evidence and examples– 15%	Uses concrete evidence (e.g., annotated screenshots, specific tasks, observed behaviors) that directly supports the analysis; examples are clearly explained and relevant.	Uses some relevant evidence and examples, but not always fully explained or consistently linked to claims.	Few or generic examples; screenshots or descriptions are present but not clearly tied to the points being made.	Little to no evidence; analysis is mostly opinion without concrete support.
Organization, clarity, coherence– 5%	Report is very well structured; ideas flow logically; headings and sections make the analysis easy to follow.	Generally well organized with minor lapses in flow or structure; overall argument is understandable.	Organization is weak; ideas jump around; sections are unclear or repetitive, making the report hard to follow at times.	Disorganized; hard to see the main points or argument; lacks clear structure.
Technical writing, formatting, presentability– 10%	Writing is clear, concise, and mostly free of grammatical errors; formatting follows the given guidelines (length, font, citation style, file naming, etc.).	Writing is understandable with some minor errors; formatting generally follows guidelines with small inconsistencies.	Frequent language errors that sometimes affect clarity; noticeable issues with formatting or not fully following instructions.	Many errors that make understanding difficult; major failure to follow format or submission guidelines.
AI-detection and originality– 10%	Detector flags at most 25% of the text as AI-generated. Writing is consistent with the student's previous work, and the student can explain key points when asked.	Detector flags between 26% and 50% as AI-generated. Most of the work still appears to reflect the student's own voice; explanations in follow-up are generally satisfactory.	Detector flags between 51% and 75% as AI-generated. There are clear style jumps or very generic sections; the student struggles to explain some important parts in their own words.	Detector flags more than 75% as AI-generated. Strong mismatch with the student's prior work and weak explanations in follow-up; work may be treated as a possible academic-integrity case under university policy.
